# Presentation Overview

# Learning Objectives

- Know the essential components of performing a patient assessment and medication history
- Understand what patient factors should be considered when selecting pharmacological treatment options
- Understand the safety concerns that should be addressed during discharge planning and medication reconciliation

# Case Scenario

# Case 1 Scenario

- 80 year old female with a history of:
  - Myocardial infarction (MI)
  - Hypertension
  - Osteoarthritis (OA) of right knee
- Patient complains of OA pain frequently interfering with her ability to perform daily activities. There is no history of recent trauma
- Patient reports using naproxen 500 mg in the past for pain relief, but reports it is no longer working
- Pain level is reported as a 6/10
- Patient recently moved in with her daughter and has not found a new primary care doctor

- ☐ What patient factors should be considered prior to initiating pharmacologic treatment?
- ☐ What would be an appropriate therapeutic option to prescribe for her pain?

# Case 1 Scenario *Explanation*

Chronic NSAID use in this patient is not ideal due to the patient's age, history of hypertension, and history of MI as NSAIDS can **raise blood pressure**, lead to **GI bleeding and ulcer formation**, and **increase cardiovascular risk**.

**Acetaminophen** is the preferred first line agent for the treatment of osteoarthritis.

- Increased age and a history of HTN suggests a potential risk for renal impairment, therefore NSAIDS should be avoided. Additionally, the American Heart Association and FDA discourage use of NSAIDs in patients with prior MI and stroke due to an increased risk of recurrence.
- Because of their minimal absorption topical NSAIDs, lidocaine patches, or capsaicin cream may also be appropriate options.

# Case 2 Scenario

It is a busy Friday night in the emergency department (ED) and the ED and hospital are at full capacity. A 25 year-old female with a history of depression and substance abuse presents with complaints of right facial pain and left leg pain after an altercation. She admits to recent cocaine and alcohol use, but denies other substance abuse.

## Home medications include:

- Sertraline 100 mg 1 po BID
- Mirtazapine 30 mg 1 po HS

## Exam Findings:

- Right maxillary fracture
- Left ankle sprain
- Multiple contusions
- ETOH level = 215 mg/dL

- ☐ **How would you treat her pain?**
- ☐ **What potential issues could arise from your treatment selection?**

The ED provider decides to admit the patient to the ED observation unit as she is intoxicated and does not have a safe means of going home. During her stay, the patient repeatedly asks for pain medication.

# Case 2 Scenario continued

- Patient was initially given **morphine 4 mg IV**, but continues to report her pain as 10/10
- Patient was then given **fentanyl 50 mcg IV**, reducing her pain to 5/10
- Observation admission orders include **oxycodone/acetaminophen 10/325 mg po Q 6 hours prn**
- The ED providers undergo shift change, the patient continues to request more pain medication
- Three hours after admission to the Observation Unit, the nurse calls the newly arrived ED physician who authorizes **hydromorphone 1mg IV x 1 dose**
- Nurse **rechecks** the patient at 30 minutes and 2 hours post administration of hydromorphone and finds the patient is asleep
- Several hours later at nursing shift change , the patient is **confused and febrile**

## Case 2 Scenario *Explanation*

- Special monitoring should be used in this patient due to her history of substance abuse and current intoxication.
- Over sedation, respiratory depression, or even death can occur in patients receiving multiple narcotic agents that are not communicated within the medical team.
- **Serotonin syndrome** may be the causative factor of confusion and fever in this patient.
  - *Serotonin syndrome*, a potentially life-threatening drug reaction, develops when serotonin levels in the body become excessively elevated from medications that either increase serotonin release or decrease its reuptake.
  - This condition typically occurs when two medications that affect serotonin levels are taken together. An example would be a patient who is taking a triptan for migraines and also a SSRI for depression. Symptoms develop on a spectrum and can range from fever and agitation to confusion and loss of muscle coordination.

## Case 2 Scenario *Explanation*

Certain opioids including meperidine, tramadol, methadone, pentazocine, propoxyphene, and fentanyl possess serotonergic activity which can be a factor contributing to serotonin syndrome. Additionally, dextromethorphan also possesses serotonergic activity. Although oxycodone is not thought to contribute to serotonin syndrome, there have been a few case reports of this occurring and further investigation of the mechanism behind this is needed. Patients taking oxycodone along with a SSRI should be monitored carefully.

In addition to pain medications there are numerous other medications that have the potential to cause serotonin syndrome. *For a comprehensive list visit*

<http://www.uspharmacist.com/content/d/feature/c/23707/>

*It is essential that practitioners be aware of potentially serious drug-drug interactions that can occur from use of multiple medications, especially analgesics.*

# Background Information

# Pharmacologic Treatment of Pain in the Emergency Department

- Pain is a common reason for seeking care in the ED. As a result pain medications are frequently administered.
- Adverse drug events (ADEs) impact more than 800,000 ED patients annually.
- Analgesics account for 8.4% of all ED visits for ADE of which 23.6% required hospitalization.
  - 6.8% were from opioid analgesics.
- While brief opioid use is generally safe for most patients, opioid analgesics may be associated with serious adverse effects like respiratory sedation and potentially death.
- Contributory factors identified for opioid ADEs include:
  - Lack of knowledge regarding potency differences among different opioids
  - Prescribing multiple opioids and administering them in various formulations (i.e., oral, parenteral and transdermal patches)
  - Inadequate monitoring
  - Inadequate patient instructions
  - Decreased health literacy

# Pharmacologic Treatment of Pain in the Emergency Department

- There are several pharmacologic treatment options to choose from when managing a patient with pain.
- Patient parameters must be considered when choosing a pain regimen.
- It is important to know trade and generic names of pain medications
  - Click here for a list of common pain medications visit <http://pami.emergency.med.jax.ufl.edu/resources/educational-materials/pharmacological-treatment-of-pain/>

## **Factors to consider prior to therapy selection:**

- |                                     |                            |
|-------------------------------------|----------------------------|
| • Type of pain                      | • Side effects             |
| • Comorbidities                     | • Drug - Drug Interactions |
| • Current and past pain medications | • Past adverse events      |
| • Allergies                         | • Patient safety           |
| • History of alcohol or drug abuse  |                            |

# PAMI Pain Management and Dosing Guide

- The **PAMI Pain Management and Dosing Guide** is a free tool for use by health care providers in hospital, EMS or acute care settings and should be used as general guide when managing pain in pediatric and adult populations.
- The guide provides treatment options for opioids, non-opioids, procedural sedation, nerve blocks, and IV/IM/IN/topical administration. It includes a step-wise approach to pain, patient safety considerations as well as nonpharmacologic interventions. To take a tour of the dosing guide, [click here](#)!
- A free downloadable pdf of the dosing guide can be accessed on the PAMI website.

<http://pami.emergency.med.jax.ufl.edu/resources/dosing-guide/>

# Pain Management & Dosing Guide

Updated August 2017

Pain Assessment and Management Initiative

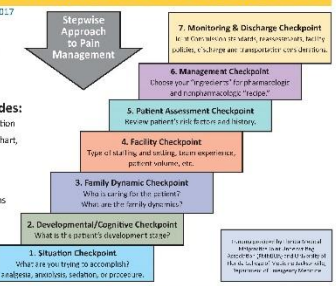

<http://pami.emergency.med.jax.ufl.edu/>

Stepwise Approach to Pain Management

### Pain Management and Dosing Guide Includes:

- Stepwise Approach to Pain Management and Procedural Sedation
- Non-opioid Analgesics, Opioid Prescribing and Equianalgesic Chart, and Opioid Cross-Sensitivities
- Intranasal and Rebolized Medications
- Procedural Sedation and Analgesia (PSA) Medications
- Non-pharmacologic, Discharge and Patient Safety Considerations
- Nerve Blocks, Neuroanesthetic and Muscle Relaxant Medications
- Ketamine Indications and Dosing
- Topical and Transdermal Medications
- Non-pharmacologic and other Interventions

### Non-Opioid Analgesics\*

Generic (brand)	Adult	Pediatric (weight)
Acetaminophen (Tylenol)	325-650 mg PO q 4-6 hrs	10-15 mg/kg PO q 4-6 hrs
Ibuprofen (Advil, Motrin)	400-800 mg PO q 6-8 hrs	10-20 mg/kg PO q 6-8 hrs
Naproxen (Aleve)	250-500 mg PO q 12 hrs	10-20 mg/kg PO q 12 hrs
Aspirin (Bayer)	325-650 mg PO q 4-6 hrs	10-15 mg/kg PO q 4-6 hrs
Topical NSAIDs	400-800 mg PO q 6-8 hrs	10-20 mg/kg PO q 6-8 hrs

\*Dose should be adjusted for renal and hepatic impairment.

### Opioid Prescribing and Equianalgesic Chart

Generic (brand)	Adult	Pediatric (weight)
Hydrocodone (Vicodin)	5-10 mg PO q 4-6 hrs	0.1-0.2 mg/kg PO q 4-6 hrs
Oxycodone (OxyContin)	5-10 mg PO q 4-6 hrs	0.1-0.2 mg/kg PO q 4-6 hrs
Morphine (Morphine)	2-4 mg PO q 4-6 hrs	0.1-0.2 mg/kg PO q 4-6 hrs
Fentanyl (Duramorph)	0.1-0.2 mg PO q 4-6 hrs	0.01-0.02 mg/kg PO q 4-6 hrs

### Procedural Sedation and Analgesia Medications

Generic (brand)	Adult	Pediatric (weight)
Midazolam (Versed)	0.05-0.1 mg/kg IV	0.05-0.1 mg/kg IV
Propofol (Diprivan)	0.5-1.0 mg/kg IV	0.5-1.0 mg/kg IV
Etomidate (Amidate)	0.1-0.2 mg/kg IV	0.1-0.2 mg/kg IV

### Pain Management Considerations

- Assess pain, reassess, monitor, document
- Use appropriate analgesic, route, dose, frequency
- Monitor vital signs, oxygen saturation, level of sedation
- Document response to treatment
- Reassess and adjust treatment as needed

### Non-pharmacologic Interventions (pediatric and adult)\*

Physical Therapy	Other Interventions
Heat/cold therapy	Acupuncture
Massage	Hypnosis
Transcutaneous electrical nerve stimulation (TENS)	Relaxation techniques

### Distraction Toolkit

For more information on non-pharmacologic interventions, visit our website at <http://pami.emergency.med.jax.ufl.edu/>

### Nerve Blocks

Type of Block	General Distribution of Anesthesia
Superficial nerve block	Superficial pain, sensation, and motor
Deep nerve block	Deep pain, sensation, and motor
Regional nerve block	Regional pain, sensation, and motor

### Topical and Transdermal Medications

Generic (brand)	Indications	Contraindications
Lidocaine (Xylocaine)	Local anesthesia	None
Fentanyl (Duramorph)	Pain relief	Respiratory depression

### Discharge Planning & Patient Safety

- Assess patient readiness for discharge
- Provide written instructions
- Follow up with patient

### Educational Pain Videos

Additional resources for patient education.

# Patient Assessment

# Patient Assessment

- When approaching a patient with pain it is essential to perform a thorough assessment including:
  - Evaluation of presenting complaint with focused physical exam
  - Past medical history
  - Current and past medications
- There are several methods for assessing pain, many find the **(O)PQRST** mnemonic to be a useful assessment tool.
- Refer to the [Basics of Pain](#) module for more detailed information regarding patient assessment and OPQRST

## PAMI Pain Assessments

<http://pami.emergency.med.jax.ufl.edu/resources/educational-materials/pain-assessment-scales/>

The following slides will discuss patient assessment.

# Physical Exam

- The physical exam can provide information regarding:
  - Location of pain
  - Severity of pain
  - Functionality
- Identifying the type of pain is essential to selecting appropriate therapy (see next slide for types of pain)
- Pain often alters vital signs (increased HR and BP)
  - Monitor vital signs to determine treatment efficacy and safety
- Refer to the [Basics of Pain](#) module for further information

Table: Types of pain, mechanism, and clinical examples

TYPES OF PAIN	MECHANISM	CINICAL EXAMPLES	PHARMACOLOGICAL TREATMENT OPTIONS*
UNDERLYING ETIOLOGY			
Nociceptive	The result of direct tissue injury from a noxious stimuli.	Bone fracture, fresh surgical incision, and fresh burn injury.	May include both opiate and non-opiate medications depending on injury.
Inflammatory	The result of released inflammatory mediators that control nociceptive input.	Late stages of burn healing, neuritis, and arthritis	Anti-inflammatory agents
Neuropathic	The result of direct injury to nerves leading to an alteration in sensory transmission.	Diabetic neuropathy, peripheral neuropathic pain, and post-herpetic neuralgia.	Tricyclic, selective norepinephrine reuptake inhibitors, gabapentinoids, or antidepressants
Psychogenic	Somatic manifestation of psychiatric illness or exacerbation of pain severity due to previous experience, poor coping mechanisms, social history, etc.		Treating the psychiatric illness may help in certain cases where pain is truly a somatic symptom of depression.
Idiopathic	Unknown	Chronic back pain without preceding trauma or obvious inciting event.	May be difficult to adequately address pain since underlying etiology is unknown
ANATOMIC LOCATION			
Somatic	A-delta-fiber activity located in peripheral tissues	Superficial lacerations, superficial burns, superficial abscess	Topical and/or local anesthetics, opiates, non-opiates
Visceral	C fiber activity located in deeper tissues such as organs	Uterine fibroid pain, pyelonephritis, biliary colic	opiates
TEMPORAL NATURE			
Acute	A neurophysiological response to noxious injury that should resolve with normal wound healing.	Acute fracture, acute knee sprain	Opiate, non-opiates
Chronic	Pain that extends beyond the time for normal wound healing with resultant development of multiple neurophysiological changes	Chronic low back pain, fibromyalgia, arthritis	Depends on the nature of the pain. Please refer to the module on chronic pain for more detailed information.
Acute-on-chronic	An acute exacerbation of a chronic pain syndrome	Sickle cell disease, cancer, rheumatoid arthritis, acute injury in chronic pain patient	

\*Nonpharmacological treatments can be considered at any time for any type of pain

# Medication History

Patients are often **unaware** of their prescribed medications and doses.

It may be difficult to obtain this information from elderly, medicated, confused or demented patients, non-English speakers, the hearing impaired, and those incapacitated due to their presenting medical illness.

**Avoid** yes and no questions, instead **ask open-ended** questions about medications and medical conditions.

**Ask** about recent medication usage including herbal and over-the-counter (OTC) medications, dose, frequency, strength, formulation, and last consumption and compare to the medical record if available.

**For example:** Instead of asking if the patient takes any medications, ask what medical problems or conditions they have and the medications they take for that condition.

# Medication History

It is essential to use a multi-factorial approach when evaluating a patient's medication history.

- Patients may not consider OTC, herbals, or PRN medications when reporting their medication history
- Patients may be using multiple agents for the same indication
- Check Prescription Drug Monitoring Programs (PDMP) in your state to help gather a complete medication history. PDMPs will be discussed in further detail later in this module.

## Review

- Past medical records
- Interview family members/ caregivers who can obtain medications from home
- Consult with the patient's primary care physician and pharmacist

## Consider

- Herbals
- Vitamins and supplements
- Sleep aids
- Samples
- Patches or topical agents
- Drops

## Medication History

## Inquire

- Distinguish between scheduled maintenance medications versus as needed or breakthrough pain therapy.
- If taking multiple therapies for breakthrough pain, how does the patient choose which one to utilize?

## Discuss

Use open ended questions to obtain the most information from the patient.  
*Note: If the pain is severe, it may be necessary to treat first.*

# Medication History: Prescriptions

***Important questions*** to ask regarding prescriptions include:

- What pharmacy/pharmacies do you use?
- What other medications prescribed by other healthcare professionals like your dentist, ophthalmologist, or chiropractor are you taking?
- What medications do you take every day? In the past week? When do you take them?

- What medications do you take only as needed? What are they? When do you take them?
- When have you used patches in the past?
- What injections have you had at the doctor's office or anywhere else?
- What sample medications has your doctor given you to take?

# Medication History: OTC and Herbals

**Important questions** to ask regarding non-prescription medications include:

## Over the Counter Medications (OTC)

- What medications do you take that do not require a doctor's prescription to purchase?
- What do you take when you get constipation or diarrhea, heartburn, cough/cold, or headache? How often? How much?
- What do you take when you get sick? How often? How much?

## Herbal Supplements

- What vitamins do you take?
- What herbal medications do you take?
- What natural supplements do you take?
- What dietary supplements do you take?

# Medication Allergies and Intolerances

- Inquire about the patients ***allergies*** to medications
  - Document reaction type
  - When the reaction occurred
  - Similar medications taken without a reaction
- Inquire about ***intolerances*** to medications
  - Patients often confuse allergies with an intolerance
  - Gastritis, nausea, and constipation are considered intolerances not allergies
  - For example: “aspirin upsets my stomach”

# Pharmacologic Therapy

# Pharmacotherapeutic Principles

## Patient Factors to Consider

- Previous effective/failed treatments
- Non-pharmacological therapies
  - Distraction
  - Watching television
  - Reading
  - Guided imagery/Meditation
  - Exercise
  - Relaxation techniques

## Patient Education

- **Educating patients** about pain is an important component to treatment
- Set **realistic expectations** and establish a mutually agreed upon “tolerable” pain goal
- Discuss with the patient that **total elimination** of pain **may not** be possible

# Opioid Therapy

There are **three** classic opioid receptors which are named based on Greek letters:

- **Mu** (all opioid agonists stimulate Mu receptors)
- **Kappa**
- **Delta**

RECEPTOR	CLINICAL RESPONSE
Mu	<b>Mu-1:</b> Analgesia <b>Mu-2:</b> Respiratory depression, sedation, miosis, euphoria, cardiovascular effects, pruritus, nausea, vomiting, decreased GI motility
Kappa	Spinal analgesia, dysphoria, miosis, respiratory depression, dyspnea, sedation
Delta	Analgesia, euphoria, dysphoria

# Opioid Therapy

Opioids are classified based on mu receptor activity

## Full Agonists:

Bind and activate the mu receptor producing a biological effect

- Morphine
- Oxycodone
- Hydrocodone
- Fentanyl
- Oxymorphone
- Hydromorphone

Preferred for acute pain

## Partial Agonists:

Bind and activate the mu receptor with only *partial* efficacy at the receptor compared to a full agonist

- Buprenorphine

Not typically used for acute pain

# Opioid Therapy

Opioids are classified based on mu receptor activity

## Mixed Agonists – Antagonists:\*

Contain properties of both an agonist and an antagonist

- Pentazocine
- Butorphanol
- Nalbuphine

Not typically used in the acute setting

## Antagonists:

Bind to the mu receptor and inhibit or decrease an agonists activity

- Naloxone
- Naltrexone

Often used in the emergency setting for reversal of opioid overdose

\* Patients on mixed agonist-antagonist therapy may require a higher doses for pain relief, however these agents display a ceiling effect in which increasing the dose over a given threshold does not lead to additional efficacy

# Commonly Used Opioids and Dosing

OPIOID PRESCRIBING CHART						
MEDICATION	Recommended start dose+ <b>ADULTS</b>		Duration of action (Hours)	Recommended start dose <b>CHILDREN</b>		Common side effects
	Oral	Parenteral		Oral	Parenteral	
Morphine IR (MSIR®)	15 - 30 mg Q 4 - 6H	2 - 4 mg Q 4 - 6H	IV: 3 - 4 PO: 3 - 6	0.3 mg/kg Q 4 - 6H	0.1 mg/kg Q 4 - 6H	Nausea Vomiting Constipation Pruritus Respiratory depression Sedation
Hydromorphone (Dilaudid®)	2 - 4 mg Q 4 - 6H	0.5 - 2 mg Q 4 - 6H	IV: 3 - 4 PO: 3 - 6	0.03 - 0.06 mg/kg Q 4 - 6H	0.015 mg/kg Q 4 - 6H	
Hydrocodone/ Acetaminophen (Norco®)	5 - 10 mg Q 4 - 6H	-	PO: 4 - 8	0.2 mg/kg Q 4 - 6H	-	
Oxycodone IR (OxyIR®) *	5 - 10 mg Q 4 - 6H	-	PO: 3 - 6	0.2 mg/kg Q 4 - 6H	-	Seizure risk- even at recommended doses (tramadol)
Tramadol (Ultram®)	50 - 100 mg Q 6H	-	PO: 3 - 6	-	-	

\*With or without 325 mg acetaminophen (Max: 4g/day of acetaminophen)

+Consider patient 's weight, prior history, and degree of pain when selecting starting dose

# Opioid Prescribing Considerations

## When switching between opioids

- Begin with a 30% lower dose than the equi-analgesic dose when switching medications
- Titrate to a safe/effective dose to achieve adequate response

### Tips

Avoid or limit acetaminophen content of medications when treating patients with hepatic impairment

## Special populations

- Use caution in:
  - Debilitated patients
  - Renal or Hepatic impairment
  - Elderly (lower starting dose due to sensitivity)
  - Neonates and infants
- Morphine has a renally eliminated active metabolite; **avoid** or use morphine with **extreme caution** when using this medication in the above patient populations
- **Hydromorphone** may be a better choice in the setting of renal insufficiency due to its short half-life and lack of active metabolites
- Avoid meperidine as safer opioids that are equally efficacious are available. Meperidine can cause neurotoxicity and serotonin syndrome.

# Equianalgesic Dosing

# Equianalgesic or Equipotent Dosing

Providers often are unsure how to convert one opioid agent to an equivalent dose of another agent, or how to change the administration route.

This concept is important for all healthcare providers to be aware of especially in chronically ill or oncology patients.

*For example,* converting a patient's home oral morphine dose to an appropriate intravenous inpatient dose. Equianalgesic dosing charts allow providers to **switch safely** between different opioid medications while still achieving adequate pain control.

# Equianalgesic Dosing

There are **two goals** when using the equipotent dosing chart:

1. The calculated starting dose must be **safe** to avoid overdose
2. The dose must be sufficiently efficacious to prevent **worsening** of the pain or withdrawal

# Equianalgesic Dosing

It is important to know that equianalgesic dosing charts do **NOT** account for patient factors

## Pharmacogenomics

- CYP enzyme up/down regulation
- Ethnic variability

## Organ system dysfunction

- Hepatic: avoid acetaminophen products
- Renal: avoid morphine

## Opiate naïve vs. opiate tolerant

- Long acting preparations may be equivalent in morphine equivalents, but may accumulate in opiate naïve patient

## Patient preference based on medication history

- Side effect profiles may vary within the same drug class

## Drug Interactions

- Combining opioids with other medications may increase or decrease opioid levels

## Contraindications due to co-morbidities

- Tramadol in seizure patients
- Meperidine in renal failure
- Morphine accumulation in renal dysfunction

## Adverse effects

- Long-acting opiates may suppress respiratory drive in patients with sleep apnea

# Equianalgesic Dosing

- Charts represent broad indicators of relative analgesic potency (ranges), variability exists between charts
- When switching between chemical classes of opiates:
  - **MUST** reduce calculated dose by **~ 30%** to account for incomplete cross tolerance
  - Avoid dosing charts when prescribing methadone due to its variability

## Phenanthrenes

- Morphine
- Codeine
- Oxycodone
- Oxymorphone
- Hydrocodone
- Hydromorphone

## Phenylpiperdines

- Fentanyl
- Meperidine

## Diphenylheptanes

- Methadone

# Equianalgesic Dosing

APPROXIMATE EQUIANALGESIC DOSING CONVERSION TABLE		
MEDICATION	Oral	Parenteral
Morphine IR (MSIR <sup>®</sup> )	30 mg	10 mg
Hydromorphone (Dilaudid <sup>®</sup> )	4 mg	1 mg
Hydrocodone/Acetaminophen (Norco <sup>®</sup> )	30 mg	-
Oxycodone IR (OxyIR <sup>®</sup> )	20 mg	-

# Resources for Equianalgesic Dosing

- Your hospital pharmacy or pain service

# Opioid Risk Assessment Tool

# Opioid Risk Assessment Tools

- There are numerous assessment tools available to help providers determine risk for misuse when prescribing opioid medications to patients suffering from chronic pain. However these tools were all developed for use in primary care settings.
- Examples of these assessment tools include:
  - Opioid Risk Tool (ORT)
  - The Diagnosis, Intractability, Risk, Efficacy (DIRE)
  - The Screener and Opioid Assessment for Patients with Pain-Revised (SOAPP-R)
  - The Screening Instrument for Substance Abuse Potential (SISAP)
- Research is ongoing to develop ED screening tools
- The next slide explains the Opioid Risk Tool.

# What is the Opioid Risk Tool (ORT)?

## The Opioid Risk Tool (ORT)

- Developed in 2005 to assess the risk of abnormal behaviors of patients prescribed opioids
- Patient reported assessment tool that can be administered and scored in less than one minute
- Identifies patients who are at high risk of abusive drug behaviors
- Limited use for patients due to being subjectively based on patient report
- Intended for use in the primary care setting and has not been validated in non-pain populations

MARK EACH BOX THAT APPLIES	FEMALE	MALE

**SCORING (RISK)**

0–3: low  
4–7: moderate  
≥8: high

Webster LR, Webster RM. Predicting aberrant behaviors in opioid –treated patients: Preliminary validation of the opioid risk tool. *Pain Medicine*. 2005; 6(6) 432-442

# Pharmacologic Therapy

## Non-Opioids

# Non-Opioids: NSAIDs

NON-OPIOID PRESCRIBING GUIDELINES					
MEDICATION	Recommended start dose+ <b>ADULTS</b>	Max daily dose ADULTS	Recommended start dose <b>CHILDREN (age &lt;12)</b>	Max daily dose <b>CHILDREN</b>	Common side effects
Acetaminophen (Tylenol®)	325 - 650 mg PO Q 4 - 6H PRN	4,000 mg/day	10 - 15 mg/kg PO Q 4H PRN	2,600 mg/day	Hepatotoxicity Rash Abdominal pain Nausea Vomiting
Ibuprofen* (Motrin®)	400 - 800 mg PO Q 4 - 6H PRN	3,200 mg/day	4 - 10 mg/kg PO Q 6 - 8H PRN	40 mg/kg/day or 2,400 mg/day	GI hemorrhage Dyspepsia Rash Edema Abdominal pain Renal dysfunction Headache
Ketorolac <sup>δ</sup> (Toradol®)	15 - 30 mg IV Q 6H PRN	60-120 mg/day X 3 days	0.5 mg/kg/dose IM/IV Q 6H PRN	30 mg Q 6H x 5 days	
Naproxen* (Naprosyn®)	250 - 500 mg PO Q 8 - 12H PRN	1,500mg/day	5 mg/kg PO Q 12H	1,000 mg/day	
Meloxicam (Mobic®)	7.5 - 15 mg PO daily	15 mg/day	-	-	Headache Abdominal pain Dyspepsia Edema GI hemorrhage

+Consider patient 's weight, prior history, and degree of pain when selecting starting dose

# Non-Opioids: Neuropathic Agents

**Dosing may vary based on new literature, patient response, and comorbidities**

NEUROPATHIC PAIN MEDICATIONS			
MEDICATION	Recommended start dose <b>ORAL</b>	Max daily dose	Adverse effects
Amitriptyline (Elavil®) Nortriptyline (Pamelor®)	25 mg QHS 25 mg QHS	200 mg 150 mg	Suicidal ideation in young patients with concomitant MDD or psychiatric disorder. Anticholinergic effects Sedation Orthostasis
Duloxetine (Cymbalta®) Venlafaxine (Effexor XR®)	30 mg daily 37.5 mg daily	60 mg/day 225 mg/day	Headache Somnolence Fatigue Orthostatic hypotension Nausea Insomnia Xerostomia
Gabapentin (Neurontin®)	300 mg daily to TID	3,600 mg/day	Somnolence Seizure risk with abrupt withdrawal Ataxia
Pregabalin (Lyrica®)	50 mg TID	450 mg/day	Fatigue Dizziness Peripheral edema Emotional distress and hostility – especially in children

# Non-opioids: Skeletal Muscle Relaxants

SKELETAL MUSCLE RELAXANTS					
MEDICATION	Recommended start dose <b>ADULTS</b>	Max daily dose <b>ADULTS</b>	Recommended start dose <b>CHILDREN</b>	Max daily dose <b>CHILDREN</b>	Common Side Effects
Cyclobenzaprine (Flexeril®)	5 mg Q 8H PRN	30 mg/day	Not Recommended Age < 15 Age ≥ 15: 5 mg PO Q 8H PRN	30 mg/day	Drowsiness, dizziness, fatigue Dry mouth (anticholinergic effects) GI upset Headache
Methocarbamol (Robaxin®)	1 g IV/IM once or 1.5 g PO Q 6H for 48 - 72H	3 g/day IV/IM For > 3 days or 8 g/day PO	Not Recommended Age < 16 Age ≥ 16: 1.5 g PO Q 6H for 48 - 72H	8 g/day	Drowsiness, dizziness, vertigo, confusion Amnesia
Diazepam (Valium®)	5 - 10 mg IV/IM 2 - 10 mg PO Q 6 - 8H PRN	40 mg/day	Not Recommended Age < 12 Age ≥ 12: IV/IM: 0.04 - 0.2 mg/kg Q 2 - 4H PRN  PO: 0.12 - 0.8 mg/kg/day divided Q6 - 8H PRN	40 mg/day	Dependence Headache Drowsiness, dizziness, confusion Ataxia Children can experience paradoxical hyperactivity or aggression
Carisoprodol* (Soma®)	250 mg Q 8H	1,400 mg/day PO	Not Recommended Age < 16 Age ≥ 16: 250 - 350 mg PO TID and QHS	1,400 mg/day	Drowsiness, vertigo, dizziness Active metabolite, which can add to sedation (meprobamate) Use should be limited (2-3 weeks)

\* Addiction potential with carisoprodol usage

## Tips

# Tips for Selecting Pharmacological Treatments

For mild-moderate somatic-nociceptive pain consider non-opioids (acetaminophen or NSAIDs) unless contraindicated.

For intermittent or continuous moderate to severe pain not managed by non-pharmacological and/or non-opioid therapy, addition of an opioid might be indicated after weighing risks and benefits.

For neuropathic pain consider gabapentin/pregabalin, tricyclic antidepressants or serotonin-norepinephrine reuptake inhibitors. For localized pain like non-radicular sciatic pain consider topical anesthetics (EMLA cream or lidocaine patches).

# Monitoring

Monitoring **before** and **after** treatment of pain is important in determining efficacy and to rule out side effects/adverse events.

Patients should be re-assessed 15 minutes following IV administration and 30 minutes following oral administration.

**Frequent** monitoring and reassessment should be conducted during procedural sedation and analgesia, as well as prior to discharge or transfer.

## Tips

If assessed too early the medication may not have had enough time to exert its therapeutic effect.

Refer to the module on [Procedural Sedation & Analgesia](#) for more information

# Special Population Considerations

# Medication Safety in the Elderly

## Decreased Renal Function

- Renal function may be reduced 50% or greater leading to increased risk of accumulation
- Changes in renal function may not be evident in the patients serum creatinine level due to the loss of muscle mass accompanied by aging
- Use special caution in opioid naïve patients

## Medication Considerations

- Pregabalin/gabapentin
  - Reduce dose to avoid sedation
- Anti-cholinergic
  - Avoid due to concerns of delirium
- Muscle relaxers (i.e., cyclobenzaprine)
  - Should be avoided
- Long acting benzodiazepines (i.e., diazepam)
  - Undergo hepatic oxidation which reduces with aging potentially leading to over sedation and increased fall risk.

# Inappropriate Medications in the Elderly

Table: Adapted from 2012 AGS Beers Criteria for Potentially Inappropriate Medication Use in Older Adults

MEDICATION	RECOMMENDATION AND RATIONALE
Meperidine	Avoid Not an effective oral analgesic in dosages commonly used; may cause neurotoxicity; safer alternatives available
Non-COX-selective NSAIDS (oral)	Avoid Avoid Chronic use unless other alternatives are not effective and patient care can take gastroprotective agent (PPI or misoprostol). Increase risk of GI bleeding/PU in high-risk groups, including those $\geq 75$ years old or taking oral or IV steroids, anticoagulants, or antiplatelet agents. PPIs or misoprostol reduces but does not eliminate risk
Indomethacin, ketorolac (Including IV)	Avoid Increases risk of GI bleeding/PUD in high risk groups (see above), Indomethacin has the most adverse effects
Pentazocine	Avoid Higher risk for CNS adverse effects such as confusion and hallucinations compared to other opioids
<b>Skeletal muscle relaxants</b> Carisoprodol Chlorzoxazone Cyclobenzaprine Metaxalone Methocarbamol Orphenadrine	Avoid Most muscle relaxants are poorly tolerated by older adults Risk of anticholinergic adverse effects and sedation

# Medication Safety in Pediatric Patients

- Many medications are metabolized in the liver via [cytochrome P450 subtypes](#) which are not fully developed in newborns
  - Hepatic enzymes reach full maturity at varying rates but generally over months 1 through 6 of age
- Newborns have a higher percentage of body water compared to adults resulting in a higher volume of distribution for water soluble drugs.
- Newborns also have reduced albumin which may alter drug binding in the plasma, or increased drug levels
- Glomerular filtration rates typically do not reach normal clearance rates until 2 weeks old leading to decreased elimination of medication
- Due to immature respiratory symptoms infants may develop apnea or periodic breathing when given even small opioid doses, monitor frequently
- Several health organizations including the FDA, the European Medicines Agency, Health Canada, and the American Academy of Pediatrics have recommended against the use of codeine in patients younger than 12, those with respiratory insufficiency between ages 12-18, and in nursing mothers due to genetic variations in its metabolism.

Refer to the module on [Pediatric Pain Management](#) for more information

# Medication Safety in Patients with Chronic Disease and Co-Morbidities

- Certain disease states that may affect drug selection include:
  - Renal or hepatic dysfunction
  - Diabetes
  - HIV therapies
  - Mental health disorders
  - Cardiac conditions
  - Disease states requiring anticoagulant use
  - History of aberrant behavior or substance abuse
  - Gastrointestinal dysfunction (peptic ulcer disease, chronic constipation)

# Medication Safety Considerations

# Allergic Reactions

## FOUR TYPES OF HYPERSENSITIVITIES

Classification	Immune reactants	Onset/Description	Example of Reaction
<b>Type I (Anaphylactic)</b>	IgE	<i>Immediate:</i> Severe and rapid occurring within seconds to 30 minutes after exposure <i>Late-phase :</i> 2-4 hours post exposure and after immediate reaction, peaks at 12 hours and subsides by 24 hours	Anaphylactic or anaphylactoid reactions: Erythema Urticaria Bronchospasms CV collapse Angioedema
<b>Type II (Cytotoxic)</b>	IgG and IgM	Hours	Drug-induced hemolytic anemia, thrombocytopenia, and granulocytopenia
<b>Type III (Immune complex)</b>	Mostly IgG sometimes IgM	3 - 10 hours	Serum sickness-like reaction Drug-induced vasculitis
<b>Type IV (T cell mediated)</b>	Th1, Th2, Th17 cells cytotoxic lymphocytes	Delayed 24 to 72 hours after antigen exposure	Allergic contact dermatitis Psoriasis DRESS, SJS, TEN

# Allergies Across Structural Classifications

Phenanthrenes	Phenylpiperdines	Diphenylheptanes
<ul style="list-style-type: none"><li>• Morphine</li><li>• Codeine</li><li>• Oxycodone</li><li>• Oxymorphone</li><li>• Hydrocodone</li><li>• Hydromorphone</li></ul>	<ul style="list-style-type: none"><li>• Fentanyl</li><li>• Meperidine</li></ul>	<ul style="list-style-type: none"><li>• Methadone</li></ul>

## Type 1 Hypersensitivity Reactions

- Use opioids with caution
- Selection of a structurally different medication may result in decreased risk of cross-sensitivity

## Histamine Reactions

- Selecting an agent with a lower histamine release potential may help to reduce symptoms

# Adverse Drug Events

Opioid analgesics are among the top medications associated with adverse drug events.

Adverse drug events have been linked to:

- Drug-drug interactions
- Inadequate monitoring
- Knowledge deficits of patient and/or prescriber
- Inappropriate prescribing and administration

Considerations to decrease risk of adverse events:

- Avoid rapid dose increases
- Consider safety concerns prior to discharge (falls, driving, etc.)
- Screening for respiratory depression risk factors
- Identify opioid tolerance/intolerance based on patient history
- Ensure the patient is not wearing a pain patch or infusion pump
- Consult pharmacy/pain management when changing the route or type of opioid

# Side Effects

Side effects attributed to pain medications may include:

- Constipation
  - Bowel ileus
  - Central nervous system sedation
  - Respiratory depression
  - Dizziness
  - Drowsiness (continues for the duration of medication)
  - Nausea
  - Urinary retention
  - Itching (may be treated with cetirizine/loratadine)
- 
- **Over-sedation (CNS depression) and respiratory sedation** can be serious side effects and may require the reversal agent naloxone.

# Adverse Drug Events

Characteristics of patients who are at higher risk for oversedation and respiratory depression

- Sleep apnea or sleep disorder diagnosis
- Morbid obesity with high risk of sleep apnea
- Snoring
- Older age; risk is
  - 2.8 times higher for individuals aged 61-70
  - 5.4 times higher for age 71-80
  - 8.7 times higher for those over age 80
- No recent opioid use
- Post-surgery, particularly if upper abdominal or thoracic surgery
- Increased opioid dose requirement or opioid habituation
- Longer length of time receiving general anesthesia during surgery
- Receiving other sedating drugs, such as benzodiazepines, antihistamines, diphenhydramine, sedatives, or other central nervous system depressants
- Preexisting pulmonary or cardiac disease or dysfunction or major organ failure
- Thoracic or other surgical incisions that may impair breathing
- Smoker
- Congenital airway abnormalities

# Opioid Induced Constipation

# Opioid Induced Constipation

- A recent study reported the number of constipation-related ED visits in the U.S. **increased** by nearly **42%** (from 2006 to 2011).
- In 2011, \$1.6 billion was spent on ED care for constipation.
  - *One causative factor for constipation are opioids.*
- A 2015 ED study found that laxatives were not routinely prescribed to adults discharged with prescriptions for opioid pain medications and concluded that routine prescribing of laxatives may improve the safety and effectiveness of outpatient opioid pain management
- Opioid induced **constipation** (OIC) is the most common side effect of opioids impacting **15-90% of patients**. OIC has been associated with:
  - higher healthcare costs
  - hospital admissions and readmissions
  - longer inpatient stays

## Tips

Providers must assess, treat, and educate all patients for the possible development of OIC to prevent complications.

# Opioid Induced Constipation

- Mu, kappa, and delta receptors are found in the gastrointestinal tract
  - Mu and delta receptors are on the gut smooth muscle
  - Mu specifically affects the myenteric plexus
- Endogenous and exogenous opioids bind these receptors resulting in:
  - Delayed gastric emptying
  - Disturbance of the migrating myoelectric complex
  - Increased anal sphincter pressure
  - Increased fluid reabsorption
  - Impaired defecation response
  - Formation of dry hard stools

## Patient Complaints

- Pain
- Bloating
- Cramping
- Gastro-esophageal reflux
- Nausea and vomiting

# Assessment of Opioid Induced Constipation

- Assessment of constipation is important in patients who are currently taking/will be prescribed opioids
  - Determine how the patient defines constipation
  - Frequency of defecation is not as important as comfortable evacuation
  - Document past and current laxatives (dose, frequency and efficacy)
- Clinicians can assess functional constipation using the standard Rome III criteria:
  - Straining
  - Passage of hard stools/ Need to manually remove stools
  - Sensation of incomplete evacuation
  - Anorectal obstruction
  - Passing fewer than three stools per week

PHYSICAL EXAM	ALARM SYMPTOMS
<ul style="list-style-type: none"> <li>• Digital rectal exam</li> <li>• Assessment of anal sphincter</li> <li>• Pelvic floor relaxation on straining</li> </ul>	<ul style="list-style-type: none"> <li>• Unexplained weight loss</li> <li>• Blood in the stool</li> <li>• Family history of colon cancer</li> <li>• Prolonged constipation despite treatment</li> </ul>

# Treatment of Opioid Induced Constipation

- The first step to managing opioid induced constipation is **Prevention**
  - Prophylactic treatment can be used in any patient regardless of opioid regimen
  - The most common prophylactic regimen consists of a stool softener and a stimulant
  - Addition of an osmotic laxative such as polyethylene glycol may be considered for patients who do not get relief with a stool softener and stimulant alone
  
- Non-pharmacological options include:
  - Increased exercise
  - Fluids
  - Dietary soluble fiber
  - Encourage defecation promptly after feeling the urge

The following table provides treatment options for OIC

**Table. Commonly used laxatives for the initial treatment of OIC**

CLASS	DRUG	DOSE	COMMENTS
Bulk Laxatives	Psyllium, Methylcellulose	Not recommended for treatment of OIC	Not recommended for OIC due to increased risk of bowel obstruction with impaired GI motility
Stimulant Laxatives	Senna (Senokot-s)	8.6 mg tablets; 2-4 tablets daily	Induces peristalsis by directly irritating the smooth muscle of the intestine
	Bisacodyl (Dulcolax)	5-15 mg daily	Cramping is a common side effect of these agents
Osmotics/ Hyperosmotics	<u>Sugar Alcohols</u> Lactulose Sorbitol	15-60 mL daily 30-45 mL daily	Orally these laxatives are not absorbed and will hold fluids in intestinal tract during transit  Lactulose: Use with caution in diabetics
	<u>Macrogol</u> Polyethylene Glycol	17 grams mixed with 8oz liquid daily	---
	<u>Saline</u> Magnesium hydroxide (Milk of Magnesia)	15-60 mL once daily	Saline laxatives: Avoid in patients with edema, congestive heart failure, chronic renal disease, heart disease or dehydration since saline laxatives can cause electrolyte abnormalities, dehydration, and fluid loss

**Table. Commonly used laxatives for the initial treatment of OIC (continued)**

CLASS	DRUG	DOSE	COMMENTS
Lubricant Laxative	Mineral oil (Fleet)	<p>15-45 mL in 24 hours (max: 45 mL in 24 hours)</p> <p>Rectally: 120 mL PR as a single dose. No more than one enema per day</p>	<p>Decreases water absorption, lubricates the intestine, and decreases colonic absorption of water.</p> <p>Patients must remain upright during administration of mineral oil and remain upright for 30-60 minutes to decrease risk of aspiration.</p> <p>Note: Prolonged use of mineral oil could lead to decreased absorption of fat soluble vitamins. Beware of drug interactions as well. It is recommended that mineral oil should not be used longer than 1 week</p>
Stool Softener	Docusate sodium	50-300mg per day in 1 - 4 divided doses	<p>Often combined with a stimulant laxative for OIC. No evidence to show effectiveness in treating OIC with a softener alone</p> <p>Adequate fluid intake is essential for efficacy</p> <p>Contraindicated with mineral oil</p>
Combination	Docusate/Senna	<p>8.6/100 mg tablets: 2 tablets once daily</p> <p>Max: 2-4 tablets daily</p>	See above

# Newer Agents Approved for the Treatment of Opioid Induced Constipation

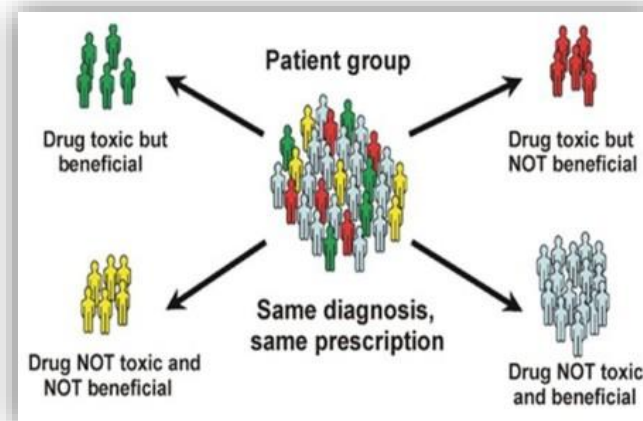

- There are several new therapies available for OIC
  - Naloxegol (Movantik)- a peripheral acting mu opioid receptor antagonist
  - Methylnaltrexone bromide (Relistor)- a peripheral acting mu opioid receptor antagonist
  - Lubiprostone (Amitiza)- a locally acting chloride channel activator.

# Special Considerations

Pharmacogenomic (Phase I & II)

Prescription Drug Monitoring Programs

# Pharmacogenomic Considerations

## Understanding Opioids and the Cytochrome P450 Enzyme System

- It is essential to understand that drug metabolism can be affected by the numerous pharmacogenomic variations in the patient population.
- When considering the metabolism of opioids, it is important to know which opioids undergo Phase I or Phase II metabolism.
  - For example, **codeine undergoes Phase 1 metabolism** and **morphine undergoes Phase 2 metabolism**.

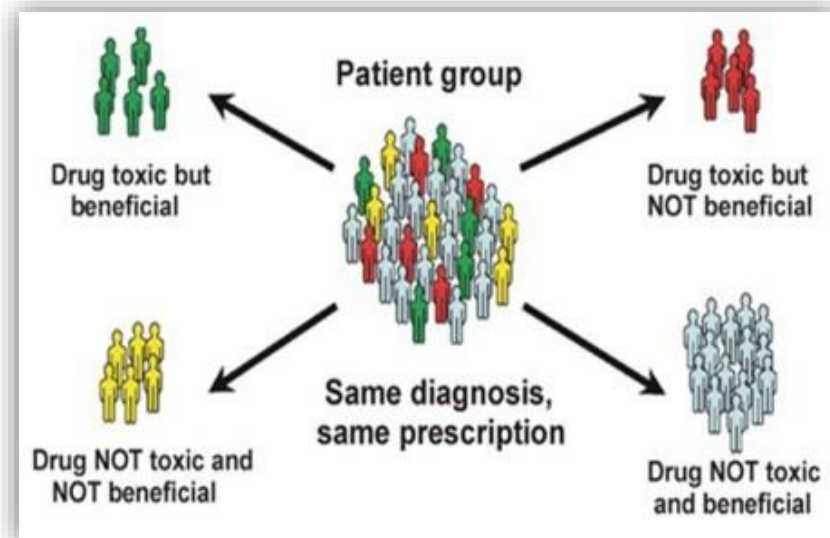

Phase I	Drug metabolism that occurs via CYP 450 enzymes
Phase II	Drug metabolism that occurs via conjugation

# Pharmacogenomic Considerations

## Understanding Opioids and the Cytochrome P450 Enzyme System

As the majority of medications undergo Phase 1 metabolism, including opioids, there is a substantial potential for drug-drug interactions. For patients who respond poorly to an agent, consider using an agent that is metabolized differently.

# Pharmacogenomic Considerations

## Understanding Opioids and the Cytochrome P450 Enzyme System (Phase I)

- The Human Genome Project studies the genetic variations that result in different enzyme activity levels
- Patients typically will not have a pharmacogenomic profile
- Prescribers should consider the genetic variability in CYP450 metabolism across different ethnicities
- The CYP450 2D6 enzyme system has four different activity levels
  - Tramadol is metabolized by CYP2D6 therefore the effects of these variations will be outlined

# Pharmacogenomic Considerations

## Understanding Opioids and the Cytochrome P450 Enzyme System (Phase I)

CYP2D6 variations	Effect on enzyme activity	Tramadol effects
Ultra rapid metabolizers	Increase enzyme activity; clear drug quickly	Could lead to overdose due to increased activity of CYP2D6
Extensive metabolizer	Normal metabolizing enzyme	Expected results from tramadol
Intermediate metabolizer	Range of effects on metabolizing enzymes	Variable responses
Poor metabolizers	Lack of effective metabolizing enzyme	No effect from tramadol since it must be converted via 2D6 to the active metabolite for analgesia response

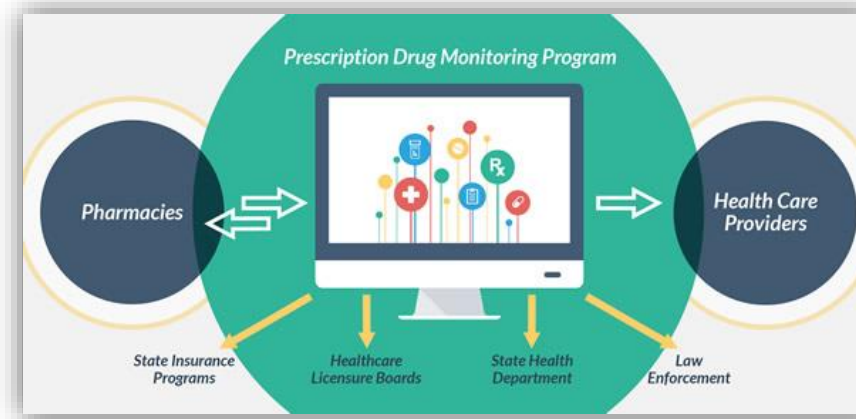

Gudin J. Opioid therapies and cytochrome P450 interactions. *Journal of Pain and Symptom Management*. 2012;44(6S):S4-S14

# Key Points of Pharmacogenetics

- Realize that some patients may not achieve adequate analgesia from certain pain medications because of insufficient drug metabolism and not because they are drug seekers.
- Still others may develop symptoms of overdose even with therapeutic doses

*An understanding of opioid metabolism can guide dose adjustments or the selection of a different opioid when analgesia is insufficient or adverse events are intolerable.*

# Prescription Monitoring Programs (PMP)

- What is a PMP?
  - A **state specific** electronic database which collects data on controlled substances dispensed
- PMPs currently do not have interstate communication
- PMPs distribute data to individuals who are authorized under state law to receive the information for purposes of their profession
  - Allows for continuity of care through various healthcare settings
  - Increased patient safety
    - Provides awareness of all active controlled substance medications on file for a patient
    - Alerts prescribers to suspected “doctor shopping”

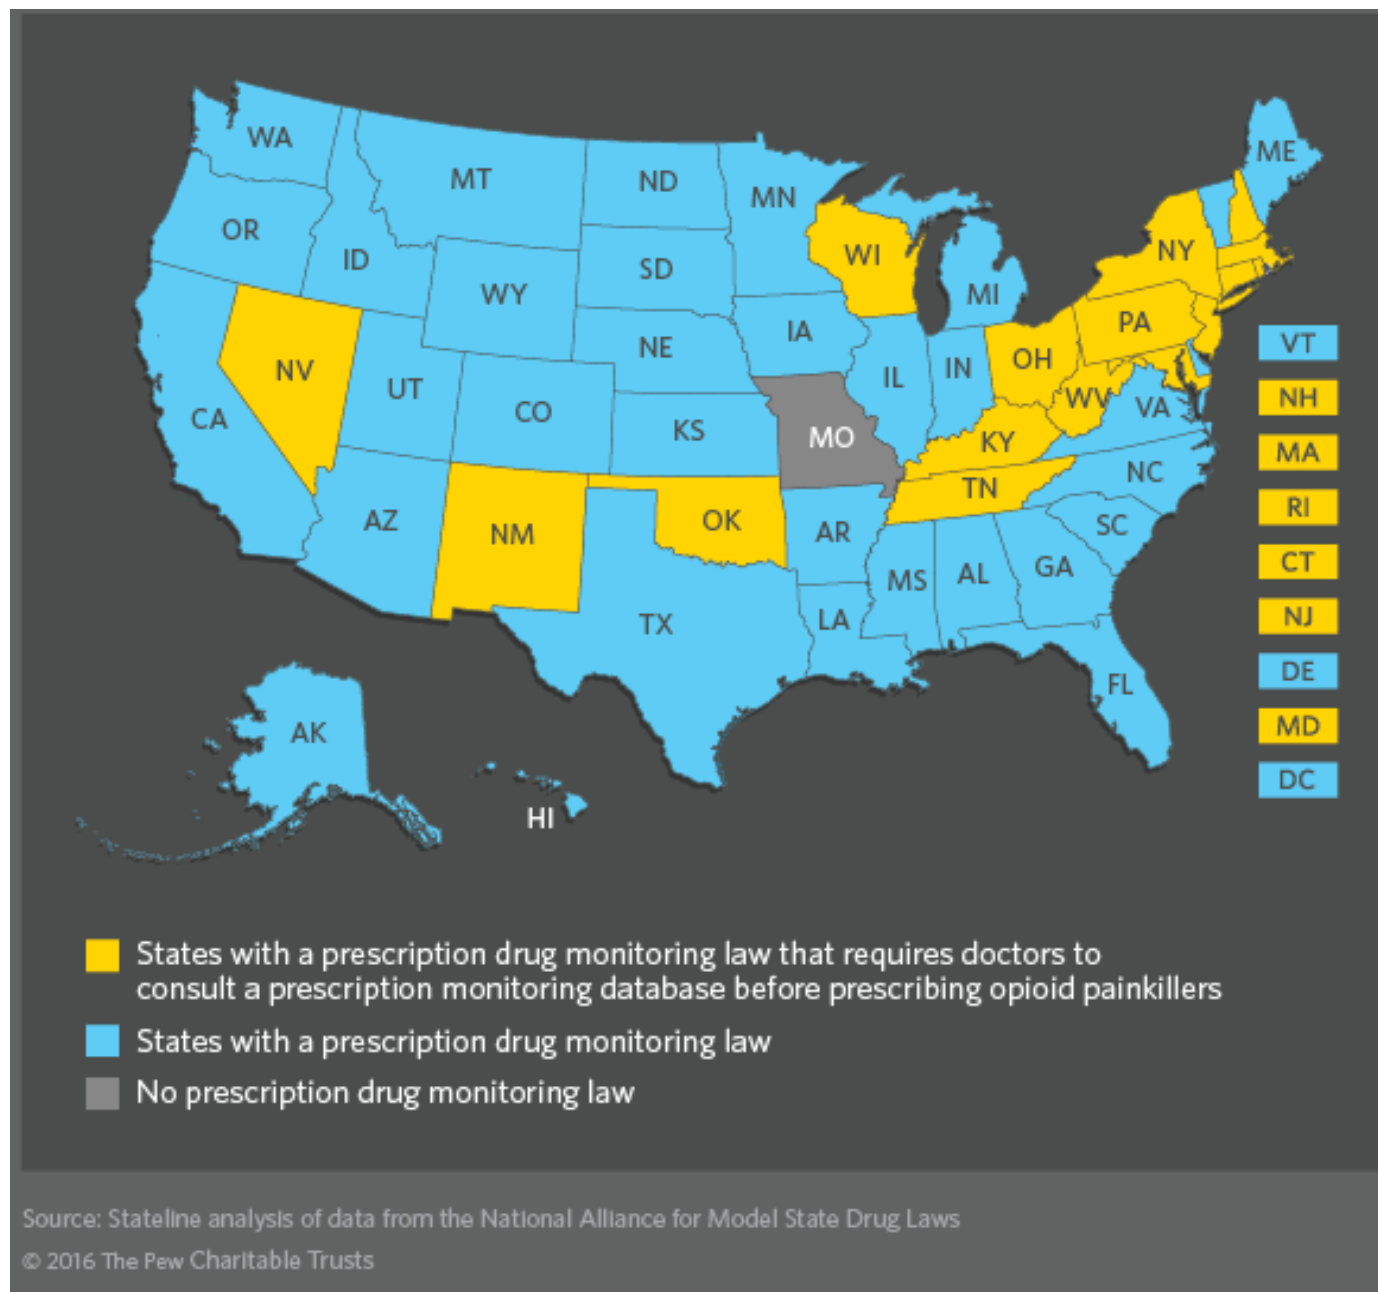

# Prescription Monitoring Program (PMP)

- Florida has the Electronic-Florida Online for the Reporting of Controlled Substances Evaluation (E-FORCSE)
  - [E-FORCSE](#) can be viewed by registered healthcare providers
  - All controlled substances *dispensed* by pharmacies **MUST** be registered in database
    - Veteran's Affairs is exempt
    - Methadone clinics are exempt
  - Pharmacies are required to submit dispensing information within a short time period. In Florida, pharmacies are required to submit information **within 7 days** of dispense date.

## Tips

The PMP is useful in verifying a patient's current or past controlled medication regimen.

# Prescription Monitoring Programs (PMP)

All entries of the PMP are in chronological order and include the following information:

1. Name of medication
2. Strength of medication
3. Prescriber's name
4. Date medication prescribed and dispensed
5. Quantity and days supply of medication dispensed
6. Name of pharmacy that dispensed the medication
7. Number of refills prescribed

# American College of Emergency Physicians policy statement on electronic prescription monitoring

- Protect patient privacy.
- Not discourage a patient with a genuine medical condition from seeking care.
- Support access to legitimate medical use of controlled substances.
- Ensure accuracy and completion of the data.
- Be voluntary.
- Provide liability protection for the practitioner.
- Minimize burdensome requirements on the physician.
- Utilize a robust monitoring system with intra-state linkages, easily accessible and navigable by practitioners seven days a week, twenty-four hours a day.
- Be limited to appropriate individuals and agencies including physicians, pharmacists and law enforcement.
- Not be used to evaluate physician's practice.
- Allow physicians to monitor their own prescribing patterns and to identify potential unauthorized use.

# There are several limitations with Prescription Monitoring Programs

- Not integrated with electronic medical record.
- Requires separate log in process with password.
- Site maintenance.
- Delay in time prescription is filled to when it shows up in system.
- If pharmacy inputs data incorrectly then the filled prescription may not show.
- Multiple records for same patient.
- Doesn't provide interpretation.
- How many overlapping rx?;
- Doesn't report type of physician writing prescription or their contact information.
- Doesn't take into account non-medical use.
- Doesn't tell you abuse history.
- Doesn't tell you if patient is in a pain contract.

# PMPs and Opioid Overdose Risks

**There have been several studies looking at using data from PMPs to predictor opioid overdose and high-risk behaviors.**

## **Predictors include:**

- Number of days receiving more than 100 morphine milligram equivalents
- Number of 'trinity' days (opioid, benzodiazepines, muscle relaxer)
- Number of prescriptions
- Multiple drug days
- Early refills

## **Predictors for high-risk behaviors:**

- $\geq 4$  opioid prescriptions  
**AND**
- $\geq 4$  providers for schedule II-V medications in the past 12 months

# Discharge Planning

# Discharge Planning

Caregivers and family members should be included in discharge planning as they often are dispensing medications to pediatric and elderly patients. Educate them about the prescribed medication name-- both generic and trade names-- to avoid confusion and potential duplication of medications.

Pain medications that can cause sedation (such as opioids and benzodiazepines) should be fully explained both verbally and in writing as it may not be appropriate for the patient to drive or do certain tasks.

## Components of Discharge Planning

- Medication education
- Medication interactions and side effects
- Medication reconciliation
- Driving and activity instructions
- Home safety and fall prevention
- Work or school releases when applicable
- Follow-up with appropriate referrals

When discharging or transferring patients recognize that pain medication drug levels may **peak** during transport times.

Patients treated in the ED should be counseled to **follow-up** with their out-patient physicians in a timely manner.

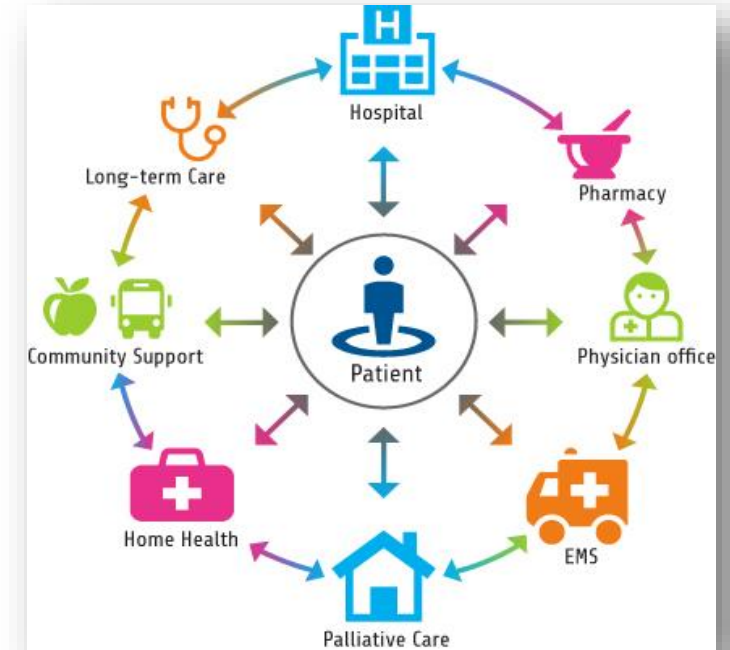

# Access to Medication Post Discharge

- Ensure that the medications prescribed are affordable for the patient
- Consider the addition of the patients diagnosis code for narcotic prescriptions to prevent complications or delays at retail pharmacies
- Some pain medications such as oxycodone or morphine may be kept in limited quantities at retail pharmacies
- Most retail pharmacists are available to communicate with hospital staff regarding medication inventory and pricing
  - Make sure the phone number on patient prescriptions leads to an appropriate person and not a general hospital number

# Transition of Care

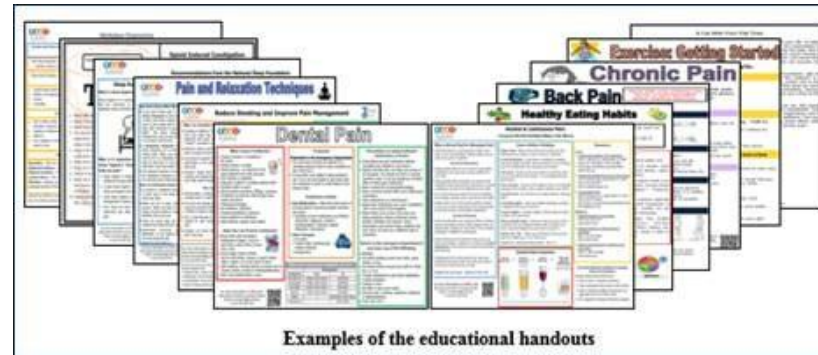

- Hospital admission
  - A full report on treatments received should be provided to the receiving medical team
    - Timing
    - Dosing
    - Efficacy
    - Side effects experienced
- Long term care discharge
  - Educate caregivers on the patient's diagnosis and medications
    - Dosing regimen
    - Side effects
    - Drug interactions
    - Follow-up

# PAMI ED Discharge Planning Toolkit for Pain

Detailed discharge instructions are a key element of reducing risk and return visits for ED patients with painful conditions and those discharged with pain medication prescriptions.

See PAMI website for more information and to download the Discharge Planning Toolkit for Pain

<http://pami.emergency.med.jax.ufl.edu/2016/10/10/introducing-the-pami-ed-discharge-planning-toolkit-for-pain/>

# Summary

# Summary

- 
- Selection of a pain regimen can be complex and requires consideration of patient specific factors
  - Opioid medications do not come without risk, patients should be evaluated frequently for drug interactions and adverse events
  - Discharge planning requires a collaborative effort to ensure patient safety

# Additional Resources

# PAMI Pain Management and Dosing Guide

- The **PAMI Pain Management and Dosing Guide** is a free tool for use by health care providers in hospital, EMS or acute care settings and should be used as general guide when managing pain in pediatric and adult populations.
- The guide provides treatment options for opioids, non-opioids, procedural sedation, nerve blocks, and IV/IM/IN/topical administration. It includes a step-wise approach to pain, patient safety considerations as well as nonpharmacologic interventions. To take a tour of the dosing guide, [click here!](http://pami.emergency.medjax.ufl.edu/)
- A free downloadable pdf of the dosing guide can be accessed on the PAMI website.

<http://pami.emergency.medjax.ufl.edu/resources/dosing-guide/>

**PAMI**  
Pain Assessment and Management Initiative

Updated August 2017

<http://pami.emergency.medjax.ufl.edu/>

## Pain Management & Dosing Guide

**Stepwise Approach to Pain Management**

- 1. Situation Checkpoint**  
What are you trying to accomplish? (analgesia, anxiolysis, sedation, or patient care)
- 2. Developmental/Cognitive Checkpoint**  
What is the patient's developmental stage?
- 3. Family Dynamic Checkpoint**  
What is the family's role in the patient's care?
- 4. Facility Checkpoint**  
Type of setting and setting, team experience, patient volume, etc.
- 5. Patient Assessment Checkpoint**  
Review patient's risk factors and history.
- 6. Management Checkpoint**  
Choose your "regimens" for pharmacologic and nonpharmacologic "regimes".
- 7. Monitoring & Discharge Checkpoint**  
Is the patient safe to discharge? (analgesia, anxiolysis, sedation, or patient care)

**Pain Management and Dosing Guide Includes:**

- Stepwise Approach to Pain Management and Procedural Sedation
- Non-opioid Analgesics, Opioid Prescribing and Equianalgesic Chart, and Opioid Cross-Sensitivities
- Intranasal and Nebulized Medications
- Procedural Sedation and Analgesia (PSA) Medications
- Pain Management, Discharge and Patient Safety Considerations
- Nerve Blocks, Neuroanesthetic and Muscle Relaxant Medications
- Ketamine Indications and Dosing
- Topical and Transdermal Medications
- Nonpharmacologic and other Interventions

**Non-Opioid Analgesics\***

Generic (Brand)	Adult	Pediatric
Acetaminophen (Tylenol)	325-650 mg PO q 4-6h Max: 4,000 mg/day	10-15 mg/kg PO q 4-6h Max: 75 mg/kg/day
Ibuprofen (Advil)	400-800 mg PO q 6-8h Max: 3,200 mg/day	10 mg/kg PO q 6-8h Max: 40 mg/kg/day
Naproxen (Aleve)	250-500 mg PO q 12h Max: 1,000 mg/day	10 mg/kg PO q 12h Max: 40 mg/kg/day
Topical NSAIDs	4-8% Lidocaine Plaster 4-8% Fentanyl Plaster	4-8% Lidocaine Plaster 4-8% Fentanyl Plaster

**Opioid Prescribing and Equianalgesic Chart**

Generic (Brand)	Adult	Pediatric
Morphine (Duramorph)	2-5 mg IV q 4h Max: 30 mg/day	0.1-0.2 mg/kg IV q 4h Max: 10 mg/day
Fentanyl (Duragesic)	2-5 mcg IV q 4h Max: 30 mcg/day	0.01-0.02 mg/kg IV q 4h Max: 1 mg/day
Hydrocodone (Vicodin)	5-10 mg PO q 4-6h Max: 60 mg/day	0.1-0.2 mg/kg PO q 4-6h Max: 10 mg/day
Oxycodone (OxyContin)	5-10 mg PO q 4-6h Max: 60 mg/day	0.1-0.2 mg/kg PO q 4-6h Max: 10 mg/day

**Opioid Cross-Sensitivities**

Generic	Dose	Comments
Morphine	1 mg IV = 10 mcg Fentanyl	1 mg IV = 10 mcg Fentanyl
Fentanyl	1 mcg IV = 10 mcg Morphine	1 mcg IV = 10 mcg Morphine
Hydrocodone	1 mg PO = 10 mcg Fentanyl	1 mg PO = 10 mcg Fentanyl
Oxycodone	1 mg PO = 10 mcg Fentanyl	1 mg PO = 10 mcg Fentanyl

**Procedural Sedation and Analgesia Medications**

Generic (Brand)	Adult	Pediatric
Midazolam (Versed)	0.05-0.1 mg/kg IV Max: 5 mg	0.05-0.1 mg/kg IV Max: 5 mg
Propofol (Diprivan)	0.5-1 mg/kg IV Max: 10 mg	0.5-1 mg/kg IV Max: 10 mg
Etomidate (Amidate)	0.1-0.3 mg/kg IV Max: 10 mg	0.1-0.3 mg/kg IV Max: 10 mg
Ketamine (Ketalar)	0.5-1 mg/kg IV Max: 10 mg	0.5-1 mg/kg IV Max: 10 mg

**Pain Management Considerations**

- Assess pain level, location, and quality.
- Assess patient's history, including allergies, current medications, and previous pain management experiences.
- Assess patient's vital signs and level of consciousness.
- Assess patient's risk factors for complications, including respiratory depression, hypotension, and aspiration.
- Assess patient's response to treatment.
- Assess patient's need for ongoing pain management.
- Assess patient's need for discharge planning and patient safety.

**Discharge Planning & Patient Safety**

- Assess patient's pain level and response to treatment.
- Assess patient's vital signs and level of consciousness.
- Assess patient's risk factors for complications, including respiratory depression, hypotension, and aspiration.
- Assess patient's need for ongoing pain management.
- Assess patient's need for discharge planning and patient safety.

**Nonpharmacologic Interventions (pediatric and adult)\***

Intervention	Comments
Physical Distraction	Use of toys, games, or other activities to divert the patient's attention from the procedure.
Behavioral Distraction	Use of music, movies, or other audio/visual stimuli to divert the patient's attention from the procedure.
Guided Imagery	Use of visualization techniques to help the patient relax and reduce pain.
Transcutaneous Electrical Nerve Stimulation (TENS)	Use of electrical current to stimulate nerves and reduce pain.
Acupuncture	Use of needles to stimulate specific points on the body to reduce pain.
Massage	Use of manual manipulation of soft tissues to reduce pain.
Heat/Cold Therapy	Use of heat or cold packs to reduce pain.

**Other Interventions**

- Use of sedatives or anesthetics for severe pain or anxiety.
- Use of opioids for severe pain.
- Use of NSAIDs for moderate to severe pain.
- Use of acetaminophen for mild to moderate pain.
- Use of topical anesthetics for localized pain.
- Use of nerve blocks for severe pain.
- Use of muscle relaxants for severe muscle spasms.
- Use of antiemetics for nausea and vomiting.
- Use of anticholinergics for drooling or excessive secretions.
- Use of antibiotics for infection.
- Use of fluids for dehydration.
- Use of oxygen for hypoxia.
- Use of ventilation for respiratory failure.
- Use of intubation for airway obstruction.
- Use of surgery for severe trauma or injury.

# PAMI ED Discharge Planning Toolkit for Pain

Detailed discharge instructions are a key element of reducing risk and return visits for ED patients with painful conditions and those discharged with pain medication prescriptions.

See PAMI website for more information and to download the Discharge Planning Toolkit for Pain
